Standard Normal Curve — Z Table

CEE 102 Statistics · Cumulative area from −∞ up to z, i.e. Φ(z) = P(Z ≤ z) · prepared for Samuel

How to use: the table gives the area to the **LEFT** of z. **Strip between two values:** Φ(upper) − Φ(lower), e.g. P(0 ≤ Z ≤ 1.2) = 0.8849 − 0.5000 = 0.3849. **Negative z:** Φ(−z) = 1 − Φ(z), e.g. Φ(−0.46) = 1 − 0.6772 = 0.3228. **Tails:** right tail = 1 − Φ(z). **Rows** = first decimal (0.0–3.4), **columns** = second decimal (.00–.09): Φ(1.24) → row 1.2, column .04 = 0.8925. Φ(0) = 0.5000.

z	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09

The Curve, Key Values & Your Exam Cases

Critical values worth memorising

Confidence	Two-tailed α	Critical z (±)	One-tailed z
90%	0.10	1.645	1.282
95%	0.05	1.960	1.645
98%	0.02	2.326	2.054
99%	0.01	2.576	2.326

Worked answers for the Session 2 exam cases

Case	Working	Answer
$P(0 \le Z \le 1.2)$	$\Phi(1.2) - \Phi(0) = 0.8849 - 0.5000$	**0.3849**
$P(-0.48 \le Z \le 0)$	by symmetry $= \Phi(0.48) - 0.5000 = 0.6844 - 0.5000$	**0.1844**
$P(-0.46 \le Z \le 2.21)$	$\Phi(2.21) - \Phi(-0.46) = 0.9864 - (1 - 0.6772) = 0.9864 - 0.3228$	**0.6636**
$P(1.08 \le Z \le 1.90)$	$\Phi(1.90) - \Phi(1.08) = 0.9713 - 0.8599$	**0.1114**

Exam tip: sketch the bell curve first, shade the region asked, then write which table entries you need. The sketch earns method marks and stops sign mistakes with negative z-values.
